

Super Water Repellent Multi-function Silicone Wiper Instructions

Thank you for purchasing our company's rain-repelling silicone wiper blade. In order to get the best experience from using this product, kindly read this manual and keep it for future reference.

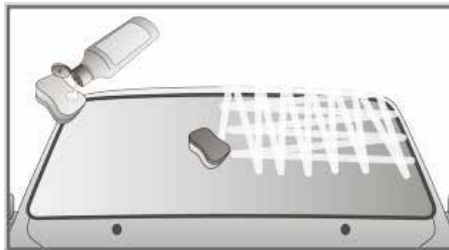

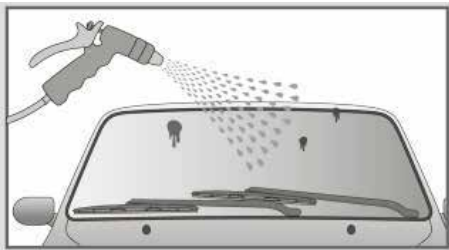

Product Features

Our silicone wiper blades are made from Japanese silicone rubber composite pre-mixed with our proprietary anti-friction and rain-repellant formula. Unlike other wiper blades which are merely coated thinly on the surface, our silicone wiper blades are blended with our special formula throughout the silicone material, making sure that our silicone wiper blades can continuously coat your windshield with rain repellent while delivering smooth and silent wiping performance for a longer time.

Plus, our silicon wiper blades are heat-resistant up to 250 degrees Celsius, which is why our silicon wiper blades easily outlast ordinary wiper blades by at least 5x.

How to Use

1. Clean or detail the glass before installing the wiper blade.

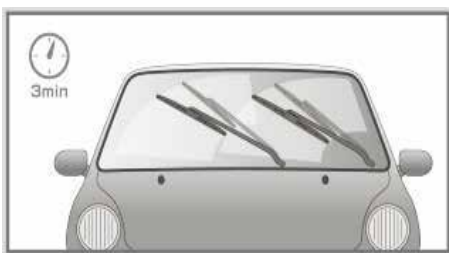

***Note: We highly recommend using a glass stripper to remove glass stains.

2. Keep glass clean and dry.

***Note: Use a glass squeegee or an old wiper blade to remove water from the glass. (Avoid using cloth as it may leave lint on the glass.)

3. Install silicon wiper blade and turn the wiper on to medium speed for 3-5 minutes. During this process, the rain repellent properties of the wiper blades are being coated on the windshield.

***Note: ① Choose the right adapter. The head of adapter must be pointing on the engraved logo of the wiper.
② Make sure the adapter is installed properly. You will hear a click sound as you snap the adapter on to the wiper blade.
③ Don't spray water during dry wiping process.
④ Before dry wiping, remove the wiper rubber protective cover.
⑤ Do not use fast wiping mode during the coating process.
⑥ During wiper installation, you may notice the gray-colored compound from the silicone rubber staining your hands. Please do not wipe off this compound from the wiper blade. However, clean your hands with soap and water after successfully installing the wiper blade.

4. Spray water to confirm the coating effect.

***Note: Repeat the whole process if necessary. During cold or humid weather, coating time may be extended by 5 minutes.
